

## EIGERFLEX-Project Switzerland, 2024

**BRUGG**

Pipes

Pioneers in Infrastructure

## Project

BRUGG Pipes is laying EIGERFLEX LONGLINE UNO 50/111 in Switzerland – 474 meters in one piece.

The above-ground installation of this innovative pipe system provides an efficient and reliable solution that has been specifically tailored to the requirements of the project. The aim was to create a continuous cold water pipe that reliably protects the medium from frost thanks to integrated heating technology.

## Implementation

The project involved the above-ground installation of EIGERFLEX LONGLINE over an impressive length of almost 500 meters.

The flexible and robust design of the pipe system made it easy to handle and install, even in challenging terrain.

Thanks to its excellent insulating properties and integrated frost protection heating technology, the pipe provides a safe and sustainable solution for the cold water supply at altitudes of up to 1,000 meters.

The work was planned with precision and executed with the utmost care to meet the customer's high quality standards. Despite challenging conditions on site, the installation was completed smoothly and on schedule.

The EIGERFLEX solution provides a long-lasting, reliable and economical infrastructure that performs well even under extreme conditions.
