Project

For our customer Lauber IWISA, we laid 70 meters of CASAFLEX CFL 60+60/162 in Chinumatta, Grächen, at over 1,600 meters above sea level. With this installation, we were able to ensure a reliable and efficient heat supply under extreme conditions.

Execution

The installation took place in an extremely steep terrain, which placed high demands on the technology and the team. Thanks to our new caterpillar winch, it was possible to place the lines precisely and safely despite all the adversities.

The flexible and robust construction of the CASAFLEX pipe system further facilitated installation and minimized the risk of damage, even under difficult conditions.

The project was implemented in close coordination with our customer Lauber IWISA. Our team mastered the logistical challenges through careful planning and the use of the latest technology.

Despite the demanding environment, the installation was completed on time and to the full satisfaction of the customer. The new line now ensures a sustainable and low-loss heat supply at this altitude.
